[Making KODAK Film](#) Feb 22 2022 The technology required to make photographic film has been a secret held by a few companies. This book explains, for the first time at this level of detail, how Eastman Kodak Company makes film. Photographic film is one of the most technically sophisticated chemical products that is used in everyday life. Over 200 complex chemical components are coated on to film base in up to 18 unique, precision layers which in total are half the thickness of a human hair. This insider's view explains in simple terms how the operation works. It is a picture book with over 25 diagrams and over 130 photographs of Kodak's production materials and equipment. Sixty percent of the printed surface area is illustrations. The book is unique; nearly all the illustrations were made specifically for this book. see www.makingKODAKfilm.com

The Chemistry of Photography Dec 11 2020 Carried in wallets and displayed in homes, photographs are a common, but often an overlooked feature of modern life. And, with the advent of digital technology many believe that the so called 'wet chemistry' behind old fashioned photography is a thing of the past - but is it? The Chemistry of Photography endeavours to unravel the mysteries of picture taking and reflects on the diversity and complexity of the science. It gives readers an insight into the chemistry needed to generate pictures, spanning all mediums including still and motion picture as well as digital imaging. Beginning with the components of conventional photography such as films and papers, the book also looks at light capture and amplification, negative films, processing solutions, colour transparencies, the chemistry of colour and motion picture films. The book concludes with a discussion of digital technology and new innovations in photography. This fascinating book will appeal to scientists and those with a general interest in both the new and the old science behind photography.
